                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 NOTE: This is a 'working draft' sequence. It currently consists of 10 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             51831 51930: gap of 100 bp 51931 62619: contig of 10689 bp in lei 62620 62719: gap of 100 bp 62720 75408: contig of 12689 bp in lei 75409 75508: gap of 100 bp 75509 92516: contig of 17008 bp in lei 92517 92616: gap of 100 bp 92517 92616: gap of 100 bp 92517 106409: contig of 13793 bp in lei 92617 106409: contig of 13793 lei 92617 106409: contig of 13793 lei 92617 106409: contig of 13793 lei 92617 106409

* NOTE: This is a 'working draft' sequence. It currently
* consists of 47 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary (ags) between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Center: Joint Genome Institute

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:
Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 1, constructed by the Sanger Centre Chromosome 1 Mapping Group. Further information can be found at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       on Jul 14, 2000 this sequence version replaced gi:8919096. During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence has been finished according to sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human DNA sequence from clone RP5-1185H19 on chromosome Contains part of a gene for a novel protein, STSs, GSSs island, complete sequence.

```

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Genes and Regions of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to EST and CDNA sequences in Unique. Genes demonstrate at least two exons flanked by consensus splice sites that maintain sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.

SEQUENCING READ COVERAGE: Attempts are made to complete double stranded sequence for all regions. All sequence is completed to a standard of coverage with a minimum of 3 reads with no ambiguities. If the sequence coverage for a region does not meet this standard, it is indicated in the annotation as Low Coverage. Low coverage linkages are verified by PCR product size verification or verification of forward and reverse reads from clones which span the low coverage area.

bases using the Consed quality parameters. Regions that do not meet this requirement are annotated as Low Quality. QUALITY OF INDIVIDUAL BASES: This sequence meets stringent quality standards - estimated average error rate is less than 1 per 10,000

Assembly program: Phrap version 0.990319 Contid length: 219769 Fraction of Phrap value < 40: 0.00293 Error Rate in Consed: 0.07 per 10,000 bases Number of N's in consensus: 0 Center project name: ACS Sequencing vector: pUC18; L08752 Chemistry: Dye-terminator Big Dye; 100% Summary Statistics

AL Submitted (30-JAN-2002) Wellcome Trust Sanger Institute, Hinxton, Cambridgeshire, CBIO 18A, UK. E-mail enquiries: humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk On Feb 1, 2002 this sequence version replaced gi:17384104. During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em., EMBL; Sw., SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at hitp://www.chori.org/bacpac/home.htm vECTOR: pBACe3.6 the entire insert of clone RP23-202F3 The true left end of clone RP23-171015 is at 179556 in this sequence. The true right end of clone RP23-153B6 is at 117857 in this sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mus musculus

**NOTE: This is a 'working draft' sequence. It currently
consists of 62 contigs. The true order of the pieces
is not known and their order in this sequence record is
runs of N, but the exact sizes of the gaps are unknown.
This record will be updated with the finished sequence
as soon as it is available and the accession number will
be preserved.

                                                                                                                                                                                                                                             A composite (incomplete) nucleotide sequence (AAT42753) and putative translation (AAW08145) sequence are provided of a motif that is found spliced to the 3' end of chicken CBD-W clone CCl4 (see also AAT42754). There are no splice donor or acceptor sites within the motif suggesting it is a final rather than an intermediary product of splicing. The motif is also found as an insert in some CHD-la clones (see also AAT42752).

                                                                                                                            A composite nucleotide sequence (AAT42752) and putative translate (AAW08144) sequence are provided of a motif that is found splice a proportion of chicken CHD-1A clones. The motif is inserted between bases 4327 and 4328 of the CHD-1A composite sequence (AAT42751). None of the 7 CHD-1 clones examined contained the complete motif. There are no splice donor or acceptor sites with the motif suggesting it is a final rather than an intermediary product of splicing. The motif is also found at the 3' end of
                                                                                                                    product of splicing.

                                                                                                                                          an antigen of the membranous structure of the inner ear protein, and is reactive with antibodies from patients having Meniere's disease. Meniere's disease is a chronic ear disease with unknown etiology. Serum from patients suffering from this disease contain autoantibodies against a 30 kDa cochlear protein antigen. The disease is believed to i an autoimmune disease. The beta-tubulin antigen is useful as a target substance in diagnosing or detecting Meniere's disease and in distinguishing this disease from other autoimmune ear diseases.

                                                                                                                                                                                                                                                                                                 cc amino acid sequences given in AAM82170 to AAM81921. (1) have cytostatic contivity, and can be used in gene therapy and vaccine production. (I) corrections and polynucleotides may be used in the prevention, diagnosis and ct treatment of diseases associated with inappropriate (I) expression. For cexample, they may be used to treat disorders associated with decreased cexample, they may be used to treat disorders associated with decreased cexample, they may be used to treat disorders associated with decreased cexample, they may be used to production of (I) additionally. (I) crossion by rectifying mutations or deletions in a patient's genome ct that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally. (I) corrections may be used to produce the secreted (I), by inserting che polynucleotides may be used to prevent, correction. (I) proteins and polynucleotides may be used to prevent, corrects and cancer metastases of haematopoietic-derived cells. AAK64703 corrects and cancer metastases of haematopoietic derived cells. AAK64703 corrected from the present inmune/haematopoietic antigen genomic corrected to account the present invention. AAK54942 to AAK5950 and AAM82169

                                                                                                                                                                                                                                                                                               alignment_scores:
                                                                                                                                                                                                                                                                                                                                                        CC anks4951 to Aak64702 encode the human immune/haematopoietic antigen (I) CC amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic CC activity, and can be used in gene therapy and vaccine production. (I) CP proteins and polynucleotides may be used in the prevention, diagnosis and CC treatment of diseases associated with inappropriate (I) expression. For CC example, they may be used to treat disorders associated with decreased CC expression by rectifying mutations or deletions in a patient's genome CC that affect the activity of (I) by expressing inactive proteins or to CC polynucleotides may be used to produce the secreted (I), by inserting CC polynucleotides may be used to produce the secreted (I), by inserting CC polynucleotides may be used to produce the secreted (I), by inserting CC polynucleotides may be used to provent, the nucleic acids into a host cell and culturing the cell to express the CC protein. (I) proteins and polynucleotides may be used to prevent, CC diagnose and treat immune/haematopoletic-related diseases, especially CC cancers and cancer metastases of haematopoietic antigen genomic Sequences from the present invention. AAK84942 to AAK8950 and AAM82169 CC represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                     Quality: 81.00

(1) have cytostatic activity, and can be used in gene therapy and vaccine production. (1) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (1) expression. For example, they may be used to treat disorders associated with decreased example, they may be used to treat disorders associated with decreased expression by rectifying mutations or delations in a patient's genome that affect the activity of (1) by expressing inactive proteins or to supplement the patients own production of (1). Additionally, (1) polynucleotides may be used to produce the secreted (1), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (1) proteins and polynucleotides may be used to prevent, and cancer metastases of haematopoletic-derived cells. AAK64703 to AAK87694 represent human immune/haematopoletic antigen genomic sequences from the present invention. AAK54942 to AAK54950 and AAM82169 represent sequences used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a spatially-addressable set of single exon concleic acid probes for measuring gene expression in a sample derived from human breast and Br 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical expression analysis is useful for assessing the toxicity of chemical expression analysis is useful for assessing the toxicity of chemical expression of ells. The microarray of this invention presents a far greater than expressed sequence tag microarrays. The method is suitable for than expressed sequence tag microarrays. The method is suitable for crapid production of functional information from genomic sequence. The present sequence is a single exon nucleic acid probe of the invention. On the sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly form MIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                              e.g. cardiovascular disease, congenital heart disease. Note: The sequence data for t
                                                                                                                The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular systems.

                                                                            The present invention provides a number of single exon nuclaic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the probes of the probes.

                                                                     The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; bone marrow expressed exon; gene expression analysis; microarray; cancer; leukaemia; lymphoma; myeloma; ss.

                                                            The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene
            expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             277
```

The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying expression in samples derived from human placenta. The probes as for antenatal diagnosis of human genetic disorders.

invention relates to single exon nucleic acid sequence is one such probe. The probes are use

probes

are tor gene (SENP)

useful

The present invention relates to novel single exon nucleic acid probes. The present sequence is one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic aetiology. The diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 420 BP;

C The invention relates to a spatially-addressable set of single exon concleic acid probes for measuring gene expression in a sample derived from human breast and ET 4/4 cells. The method involves contacting control of the probes with a collection of detectably labelled nucleic acids control of the probes with a collection of detectably labelled nucleic acids control of the probes are useful for concode proteins. They are useful for gene discovery, and for concode proteins. They are useful for gene discovery, and for concode proteins. They are useful for assessing the toxicity of chemical cayents on cells. The microarray of this invention presents a far greater content of the expression analysis is useful for assessing the toxicity of chemical cayents on cells. The microarray of this invention presents a far greater content sequence is a single exon nucleic acid probe of the invention. On the expression and for this patent did not form part of the content of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

/note="Tector: pBluescript II SK+; Site_1: EcoRI; Site_2: XhOI; The cDNA library was constructed from mRNA isolated from the epicotyls of 2 week old seedling for the cultivar Williams. The seedlings were germinated in a growth chamber, excised above the soil level, and the plants were placed in a 100 ppm solution of auxin for 24 hours prior to harvesting. Complementary DNA was synthesized

EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the EcoRI-XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into DH10B host cells (GibcoBRL). This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             85.50

//db_xref="taxon:3847"
//clone="dm:1070-6747"
//clone_lib="Gm:1070-6747"
//clone_lib="Gm:1070"
//note="The library Gm:1070 is a sequence-driven, reracked set of 9,216 clones selected from cDNA libraries from various tissues and stages of development of soybean that represent 2,639 sequences from immature cotyledons, 1,700 from immature seed coats, 3,938 from flowers, and 869 from young pods. The 5' ESTs of the source clones from the different libraries was used to select singletons, or a representative of each contig, which were reracked to form library Gm:1070. The cDNA clones of the reracked to form library serve then sequenced at the 3' end. The contig analysis to select unique genes was performed by the laboratory of Ernest Retzel, Center for Computational Genomics and Bioinformatics, University of Minnesota, http://www.cbc.unm.edu/ResearchFrojects/Soybean/index.html. Reracking was performed by Genome Systems, 5t. Louis, http://www.genomesystems.com, and 3' sequencing by the keck Center for Comparative and Functional Genomics, University of Illinois, http://www.life.uiuc.edu/biotech/keck.html. Note: The corresponding 5' EST from each clone in the Gm:1070 library is listed in the 'OTHER EST' field. The detailed information on the source library for each clone can also be obtained by referring to the Genome Systems clone ID of 'OTHER EST'."

//tissue_type="whole seedling without cotyledons removed at the time of harvest. The seedlings for the cultivar Ogden were grown in a growth chamber using germination paper.
Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a xhor restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by Xhol digestion. The CDNA fragments were directionally cloned into the EcoRI xhol restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into DH10B host cells (Gibco BRL). This library was constructed by Dr. Randy Shoemaker."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  synthesized from mRNA using a primer consisting of a poly (dT) sequence with a XhoI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the EcoRI-XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into XLIO-Gold host cells. This library was constructed by Dr. Randy Shoemaker and Dr. John Erpelding."
